ABSTRACT

The **Lyrics Similarity & Attribution System** is a Java-based application that uses Data Structures and Algorithms (DSA) to compare song lyrics and identify their most likely source. The system stores a collection of lyrics and allows users to submit a query lyric for analysis. Using efficient data structures such as HashMaps and Arrays, the application performs fast searching and retrieval of lyric data. String matching and similarity algorithms are applied to compare the query with stored lyrics and calculate similarity scores. The results are ranked and displayed to help users find matching songs or related lyrical content. This project demonstrates the practical use of searching, sorting, and text-processing techniques in Java. It helps users detect similar lyrics, identify possible sources, and understand how text comparison systems work. The project enhances knowledge of DSA concepts while providing an efficient solution for lyric analysis and attribution.
